Description Galaxian flickers on scrolling when using a real cartridge. This does not happen when using the virtual cartridge. I suspect its down to the antic writes happening on the 2nd colour clock of a cycle rather than the first. Might be worth shifting the default execution cycle later vs antic then trying acid 800.

I see lots of acid fails after adding the PBI support. This effectively adds the same delay as when using the cartridge so I expect its the same issue.
