Description

i Am attaching two demos that are set to run on an PAL Atari with 576k or 1meg ram
in both the background music is not like on a real ATARI, maybe a channel is missing, i am not sure but the music does not sound the same..

in Gene demo during the demo the AUDIO LEVEL increase by itlsef

Interesting. Did the Atari you tested on have dual pokey?

v9 only changes pbi support, no pokey work.

Just trying gene.xex - any particular point that you hear the difference? I'll have to check my real Atari later - nice demo, at least it sounds good on Eclaire even if its wrong ;-)
